

Instruction on how to Run Solutions:

- 1) Extract from Zip to a folder
- 2) Open folder
- 3) Run index.html in your browser

Given, the time, there is nothing I would've changed. However, I have a few comments.

I wrote this in Sass, so to view my style, you should check stylesheet.scss and not stylesheet.css (which is the css that was compiled from scss). My JS file is also attached to the .html document to include some functionality.

The requirements did not ask for hover states, so I did not include them because I did not want to go out of the scope of the assignment. However, I could've done them within the time frame.

You mentioned SEO, but the mockup does not include an H1. I would have just put one offscreen for better SEO but this was not explicitly said in the requirements.

You can also click on the shopping icon bag on the top to get to shopping cart bag or you can click on the "shop now" button and the shopping cart will display.

The shopping cart and the newsletter confirmation modal mockup do not have a close button so to close them, you click off of the modal.

Try entering a wrong email, and there should be a display not allowing you to view the email submission. Then type in the correct email, and an email confirmation modal should pop up. To click off, you can either click off the screen or click the confirmation button.

Other than, I think this was all and I look forward to hearing from you very soon.
